## Supplementary Material: Robust Two-Layer Partition Clustering of Sparse Multivariate Functional Data

Zhuo Qu<sup>1</sup>, Wenlin Dai<sup>2</sup> and Marc G. Genton<sup>1</sup>

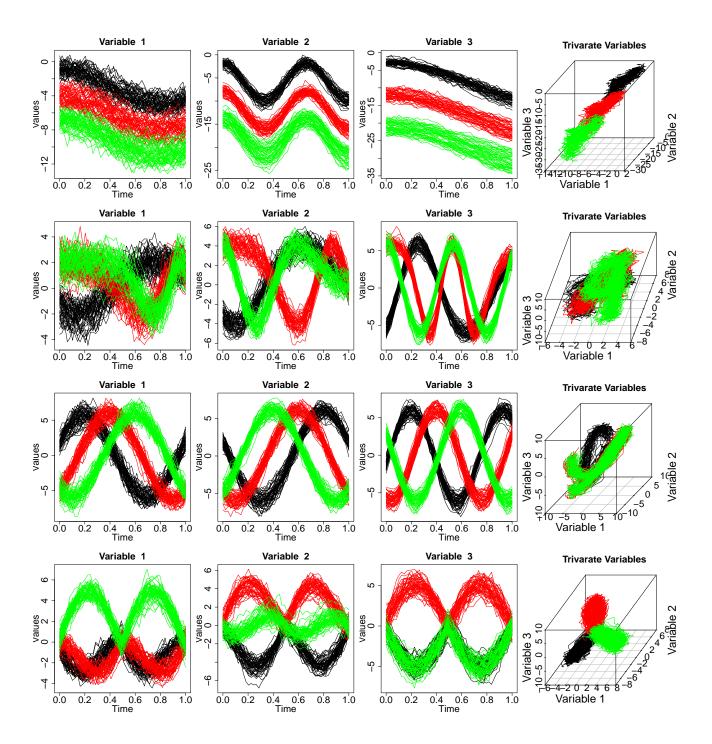

October 25, 2022

This Supplementary Material provides the results of Scenarios 1-6 in the Simulation Studies. First, we present one simulation of all the above scenarios without the outlier and sparseness corruption. Next, we display the performance of clustering for Scenarios 1-6. Then, we show the performance of outlier detection for Scenarios 1-6.

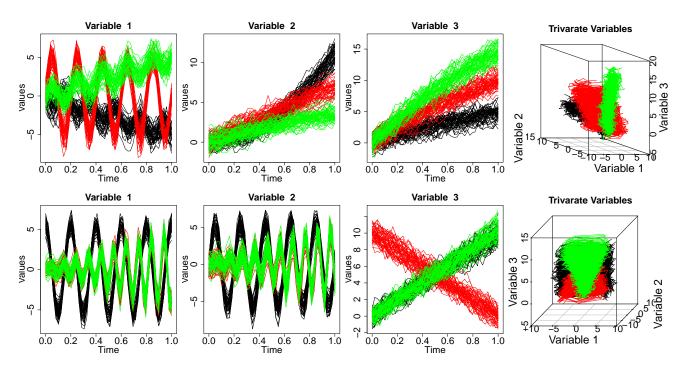

Figure S1: Rows from top to down represent samples from Scenario 1-6, respectively. Three clusters are represented in black, red, and green.

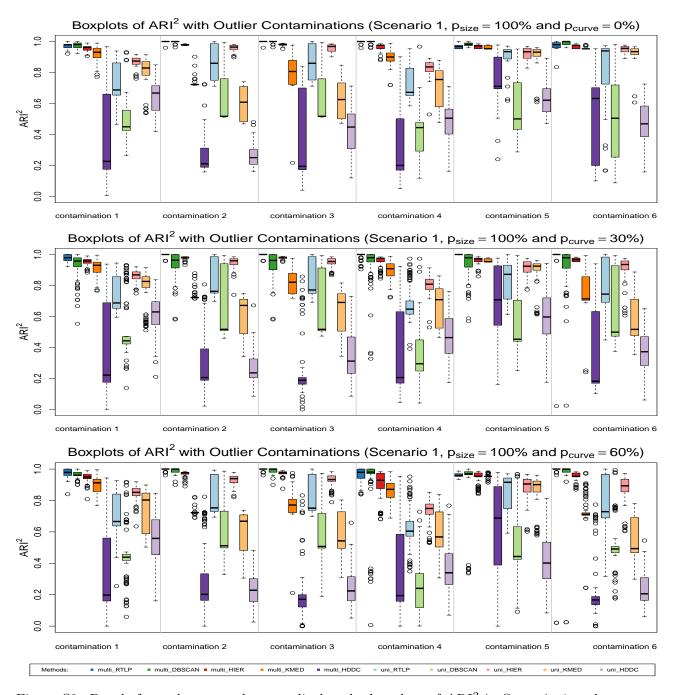

Figure S2: Panels from the top to bottom display the boxplots of ARI<sup>2</sup> in Scenario 1 under  $p_{curve} = 0,30\%$  and 60%. Ten methods are compared in all settings with six contaminations. Here, K=3 and 100 simulation replicates. The methods from left to right are the multivariate and average marginal univariate versions of RTLP, DBSCAN, agglomerative hierarchical, K-medoids, and funHDDC methods.

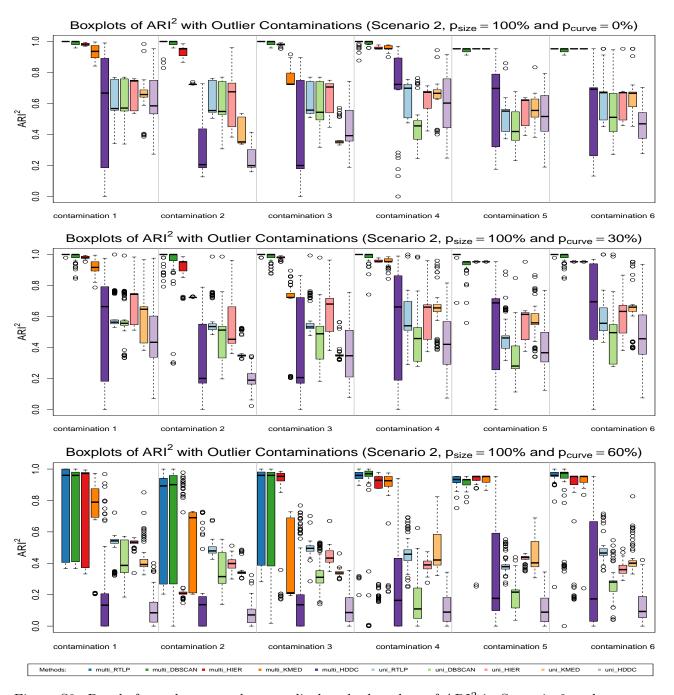

Figure S3: Panels from the top to bottom display the boxplots of ARI<sup>2</sup> in Scenario 2 under  $p_{curve} = 0,30\%$  and 60%. Ten methods are compared in all settings with six contaminations. Here, K=3 and 100 simulation replicates. The methods from left to right are the multivariate and average marginal univariate versions of RTLP, DBSCAN, agglomerative hierarchical, K-medoids, and funHDDC methods.

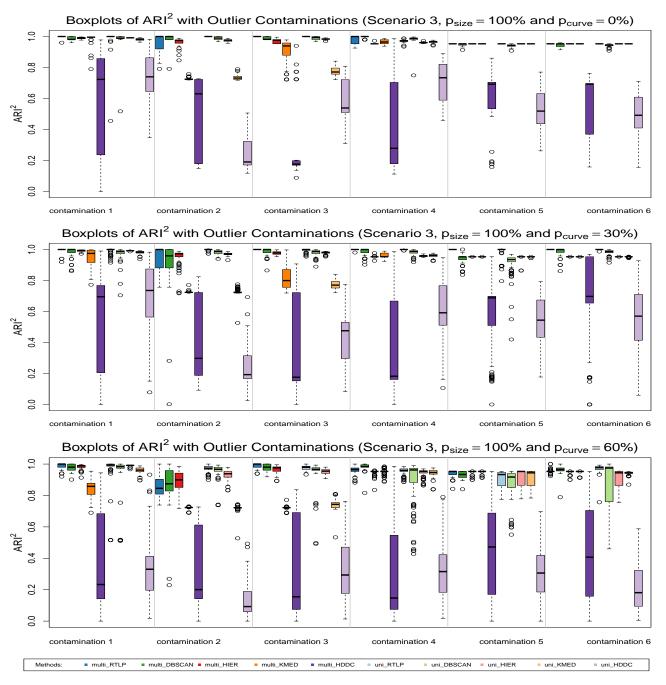

Figure S4: Panels from the top to bottom display the boxplots of ARI<sup>2</sup> in Scenario 3 under  $p_{curve} = 0,30\%$  and 60%. Ten methods are compared in all settings with six contaminations. Here, K=3 and 100 simulation replicates. The methods from left to right are the multivariate and average marginal univariate versions of RTLP, DBSCAN, agglomerative hierarchical, K-medoids, and funHDDC methods.

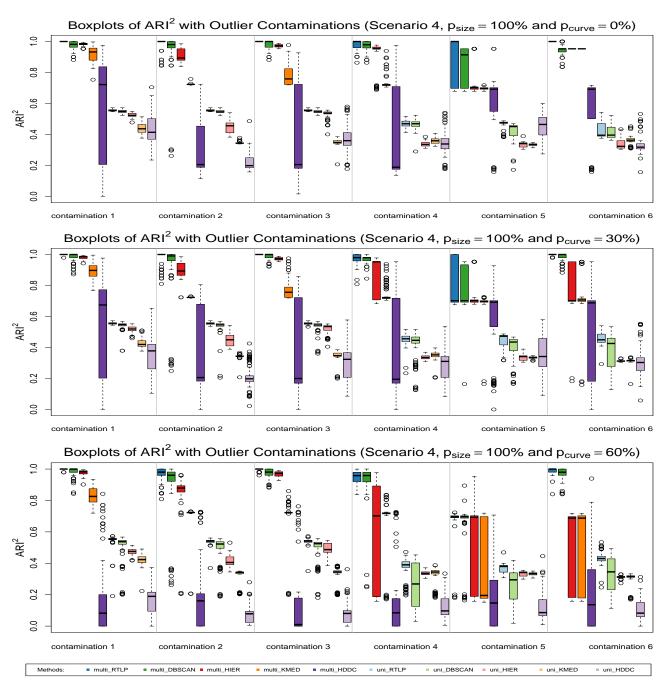

Figure S5: Panels from the top to bottom display the boxplots of ARI<sup>2</sup> in Scenario 4 under  $p_{curve} = 0,30\%$  and 60%. Ten methods are compared in all settings with six contaminations. Here, K=3 and 100 simulation replicates. The methods from left to right are the multivariate and average marginal univariate versions of RTLP, DBSCAN, agglomerative hierarchical, K-medoids, and funHDDC methods.

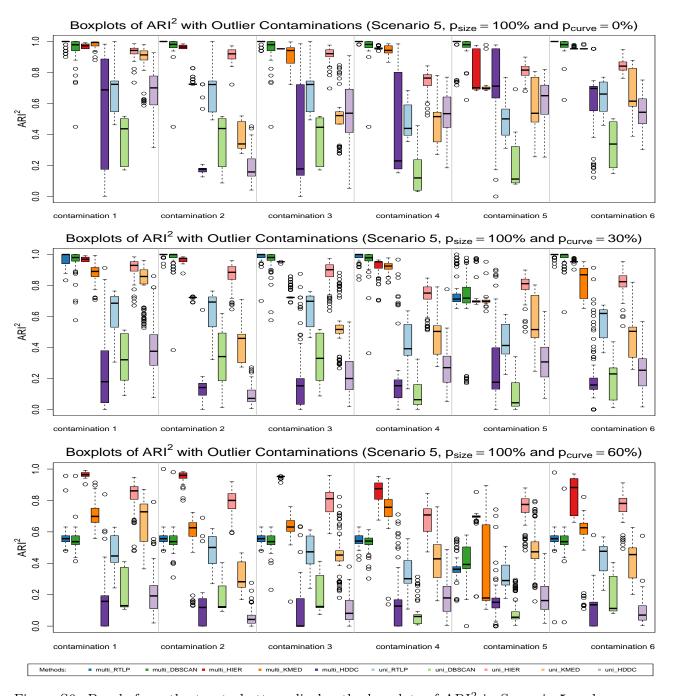

Figure S6: Panels from the top to bottom display the boxplots of ARI<sup>2</sup> in Scenario 5 under  $p_{curve} = 0,30\%$  and 60%. Ten methods are compared in all settings with six contaminations. Here, K=3 and 100 simulation replicates. The methods from left to right are the multivariate and average marginal univariate versions of RTLP, DBSCAN, agglomerative hierarchical, K-medoids, and funHDDC methods.

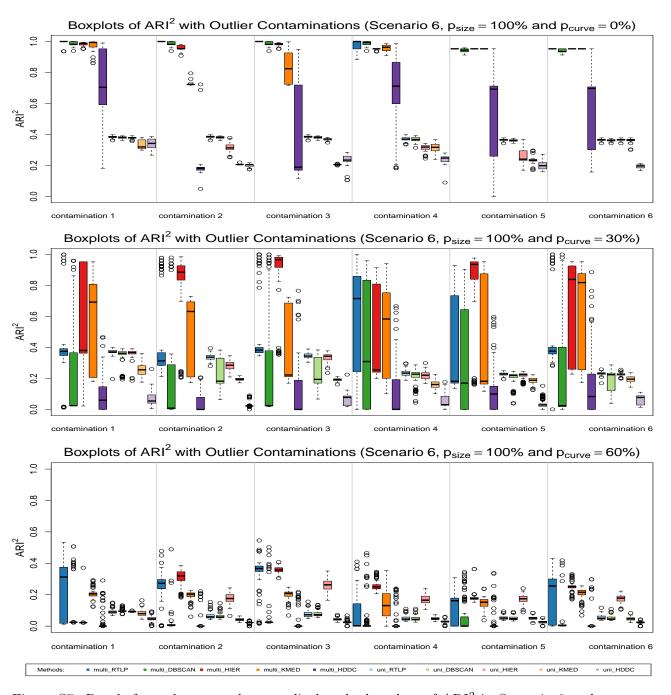

Figure S7: Panels from the top to bottom display the boxplots of ARI<sup>2</sup> in Scenario 6 under  $p_{curve} = 0,30\%$  and 60%. Ten methods are compared in all settings with six contaminations. Here, K=3 and 100 simulation replicates. The methods from left to right are the multivariate and average marginal univariate versions of RTLP, DBSCAN, agglomerative hierarchical, K-medoids, and funHDDC methods.

Table S1: Correct outlier detection percentage  $p_c$  (%) and false outlier detection percentage  $p_f$  (%) for multivariate and univariate RTLP and DBSCAN with different outlier contaminations for Scenarios 4 and 5. Higher  $p_c$  and lower  $p_f$  values for each setting given the contamination and  $p_{curve}$  are indicated in bold. The proportion of outliers is 10%, and  $p_{size}$  is 100% for all settings. Simulations were conducted with 100 replicates.
